Hi,

We have a Win2k3 TS in workgroup mode that connects us to our Netware server. We're (finally!) getting rid of our Netware server & replacing it with a Win2k3 server. The new server will be a domain. What's the best practice for changing the TS server from wg mode to domain mode? Just join the domain? Make it some sort of a controller? These will be our only 2 servers.

Thx,

DD
