I've been using the automatic update until Nov when it suddenly stopped.
(I have no problem connecting manually using the browser.)

Where is this procedure fired off? Is there a task running somewhere that I cannot see. I had similar problems with Norton Liveupdate due to a setting of pwd on my admin account (from using pwd blank), where I had to manually enter the new pwd in the specific task.

This is a copy of my latest successful autoupdate:

```
