My system cannot wake up properly after standby, It always crash, Show BSOD just a second and then restart automatically.
That problem never happened with SP1.

I supposed there's a device driver problem but I already use all latest drivers for my hardware such as Logitech mouse + keyboard cordless MX Duo, ATI Radeon 9800, Intel 875P mainboard and Audigy 2 sound card.

So what should I do now?

Btw I already contact Microsoft Support and it seem Microsoft ever got same several problems too like that with specific machines from users and they are now trying to find the root of the problem to fix that issue. I just cant wait when they can fix it!

Microsoft support told me to remove SP2 for a while, but I think I will not do that because there are so much security improvements within SP2 that I cannot find with some piece of updates.

Does anyone here already knew to fix that problem?

Any help would be appreciate.

Thanks.

Rio
