Jim,

Thanks for the response.

I checked the Local Security Settings on several machines.

Restore Files and Directories and Manage Auditing and Security Log are already assigned to the Administrators group. Take Ownership of Files or Other Objects wasn't. For us, that's a domain level policy, so I went and added one of our user groups to the domain policy. It was set for just Domain Admins. After setting, I went back to one of the workstations and ran gpupdate to ensure that the workstation got the new policy. I double-checked in Local Security Settings again and, sure enough, that group showed as having that right. Logged in as a user from that group, I tried again to run windows update. Again, the update failed. I also tried logging completely out and back in and then running windows update and still no luck.

Do you or does anyone else have another suggestion?

Thanks,

Tim
