I cannot update Win2K Server I assume from the moment when I installed Rollup 1 for Win 2k SP4. I was getting 0x8007041D error. After reading some messages I enabled COM+ Event System service, and at that moment (before rebooting) I started to get 0x80070420 error message instead. I noticed that COM+ Event System as well as automatic Updates are in starting state, so I was not able to stop it or to restart. I made both of them manual and rebooted the computer. COM+ again appeared in the starting state. I tried to run Automatic updates I got again permanent starting state. When I tried to run Windows Update, Explorer showed blank screen which looks as if it is busy waiting for some service to start up& I tried to stop my AVP (I do not have Eset NOD32 which could result in errors similar to what I have), but it did not help.

Twice I got viruses recently (articles about zotob are all over the Internet) and I do not know how to protect my server!

.
