Have the latest BIOS for your motherboard? There were some early problems with SP2 and certain processors/chipsets.

It's been almost a whole month and there were four people that found the article helpful, but no replies helping my situation. I still am stuck with a fresh install of XP Pro with no SP1 or SP2. My system runs great and I run a tight network with perimeter protection, but I prefer to have the latest software and security updates. If anyone has experienced this problem of continuous reboots after installing either the SP1 or SP2 service packs, typically at the agp440 process, I would appreciate a reply.

"I" originally wrote (a month ago):

I purchased a new HD and installed a stand-alone, non-domain, fresh copy of XP 4x with same end results. First steps: Immediately after installing XP, I ran MS Update and installed latest update and rebooted. Ran MS Update again and installed SP2.

1st & 2nd attempts: System rebooted continuously even when I tried the various Safe Mode and LKGC options. I then turned off reboot option in the Windows Advanced Options boot menu and got the BSOD STOP 0x0000007B (0xF8FC7528, .) error message. I ran through the various KB articles and then through the various aumha.org articles with the same end results.

3rd attempt: I disabled the agp440 service through the Recovery Console and had the same end results. The system would reboot at the mup service when attempting the Safe Mode options. System rebooted continuously even when I tried the various Safe Mode and LKGC options. I got the same BSOD STOP

## Re: New Drive XP Fresh Install – Reboots after SP2 upgrade

error  
again.

4th attempt: I tried the repair option rather than deleting the partition for a fresh install. All seemed well as the system finally made it much further than just the first two bars on the startup splash screen. The system then rebooted again and I disabled the reboot option in the boot menu to get a Stop: c0000135 error. Going through the KB once again, there were no resolutions that prevented the same end results.

I'd rather not be pointed to any of these KB articles as is typical of the MVP community:
