Does the Domain use WSUS for updating ? If so then it's very likely that Group Policy is what's preventing BITS from functioning as you would like. It would be best to contact the System Administrator to find out whether this system should be updated outside of the Domain.

Everytime I tried to update a XP Pro system, it fails, and I have to run the BITSservice.reg I downloaded from Castlecops.com, restart the computer and then it will be able to run Windows Updates. However, the same problem occurs the next time I try to do an update, and have to run the same registry file again. Anyone has any idea how to permanently fix this problem?

Also, not sure if this has something to do w/ it, but this problem only occurs when the XP Pro system is part of a domain, update runs fine when I disjoint the system from the domain.

Thanks in advance.
