I loooove full quotes.... especially when combined with top posting and deliberately inserted line breaks in the quoted text.

I was referring strictly to doing a live update, not downloading them separately and installing manually.

.... and deliberately choose not to mention this restriction.

Do I need to tell you that the Windows Update Agent has an API and is scriptable so there's the possibility to perform an online update with just VBScript?

What's this "live update" BTW? I've heard of "live messenger" and some more "live something" but not yet "live update".-)

And you can take your net-nanny top posting crap and put it where the sun don't shine.

Your wording is even nastier than your top posting crap.

If I'd forget my education I might be tempted to say "Geh doch dahin wo der Pfeffer wächst".

|

| NO!

| That's just wrong and misleading: IE resp. an ActiveX control are required

| ONLY when using the online Windows Update at (say)

| <http://windowsupdate.microsoft.com/>

|

| All the updates can but be downloaded manually with almost every browser

| when you're able to locate them; typically the knowledge base article or

| the security bulletins provide the links.

| The installation too also doesn't require IE.

|

| The third and most simple way doesn't require IE nor tedious searching for

| updates at all: turn on the "Automatic Updates" and configure them to your

| heart.
