Is there any version of Sun's java showing in Add/Remove Programs ?

The will be listed as J2SE Runtime Environment 1.x.x Update x

If any are, uninstall them.

Then go here <http://java.sun.com/javase/downloads/index.jsp>

and click the Download button next to Java Runtime Environment (JRE) 5.0 Update 9

Put a mark next Agree to license

Download the Windows Offline installation package and SAVE it, do not run it.

Close the browser and then install it.

NOTE: Checking for the download just now brought up a message that the server is down for maintenance. Knowing how Sun operates, there may be a newer version of the JRE when it comes back up with no explanation as to why. YMMV

I did a repair install of XP Pro using an autostreamed CD of SP2.

After resolving Windows Installer 3.1v2 file access errors and installing all security updates and upgrading to IE 7, I can no longer perform an update of Sun's JRE.

Any error message dialog window when I download the latest JRE via IE 7 is closing before i can see them.

I can't run any Java apps on my computer any more.

Firefox did display a update fails with -203 message when i tried updating the JRE using it.

Any suggestions?
