Hi Allen – There apparently is. Even if you're not still having problems, this would be a good idea:

The newly released 'standalone' version of Windows Update Agent 3.0, v. 7.0.6000.374, for 32 bit machines is available here:

<http://download.windowsupdate.com/v7/windowsupdate/redirect/standalone/WindowsUpdateAgent30-x86.exe>

You will also need to install or re-install KB927891, here:

<http://support.microsoft.com/?kbid=927891> for a complete fix.

For those using Windows Server – Courtesy of Bobby Harter, Program Manager, WSUS, Microsoft, WSUS 3.0 was released on April 30th and is available now on the Microsoft Download Center. Full information, documentation, samples and links to the bits can be found here: <http://www.microsoft.com/wsus>. WSUS 3.0 RC will be supported until May 31st 2007 – WSUS 3.0 supports upgrade of WSUS 2.0 SP1 and WSUS 3.0 RC.

The MS WSUS team believes that this solves all three 'svchost' problems that folks have been experiencing. See here:
