OK – now try downloading and running Dial-a-Fix from  
<http://wiki.djlizard.net/Dial-a-fix>

Tried that and no joy unfortunately, Have you any other suggestions?

You are still getting "Files required to use Windows Update are no longer registered or installed on your computer."??

Maybe you should try a complete re-installation of the latest version of the Windows Update client agent:

For 32-bit systems, download and save to hard disk, and then install:

<http://download.windowsupdate.com/v7/windowsupdate/redirect/standalone/WindowsUpdateAgent30-x86.exe>

If this produces an error message about "Update agent already installed", then execute the installer again manually, with parameter /wuforce as in (at a command prompt window):

WindowsUpdateAgent30-x86.exe /wuforce

Then visit Microsoft Update again, and report back whether your problem is fixed.

If it still says that some files are missing, it might be worth doing a complete check of your Windows installation: open a command prompt window and type

sfc /scannow

Re: Windows Update not recognising it is installed.

and have your original XP installation CD in the CD drive.
