If you're comfortable poking around in the registry, then we can give this a shot. Otherwise, I don't see how you can repair MDAC without uninstalling and reinstalling SP2. SP2 is what installed MDAC 2.8 SP1.

We'll just **check** the registry and not make any changes yet, OK ?

**** Please make notes on your findings ****

Go to Start > Run > type in

regedit

Click OK

Now click Edit on the Menu Bar at top, then click Find

Under 'Look at', make sure that Keys, Values, and Data are checked.

There's no need to check the bottom box next to 'Match whole string only'

Copy and paste this into the 'Find what: ' line

MDACVer.Version

Click the 'Find Next' button

The first instance of it should be in a folder with a CLSID of

{54AF9350-1923-11D3-9CA4-00C04F72C514}

A subfolder of the above, named ProgId should be open

In the right frame, under Data, it should show MDACVer.Version

Click on each subfolder under {54AF9350-1923-11D3-9CA4-00C04F72C514}

The first subfolder InProcServer32 should show in the right frame under Name, Default, under Data,

D:\WINDOWS\system32\odbccconf.dll

For 'ThreadingModel' Name is Default, the Data should show 'Apartment'

InstalledVersion – Name: Default Data: 2,81,1117,0

ProgId – Name: Default Data: MDACVer.Version.2.81

Pogrammable – Name: Default Data: (value not set)

TypeLib – Name: Default Data: {54AF9343-1923-11D3-9CA4-00C04F72C514}

Version – Name: Default Data: 2,81,1117,0

VersionIndependentProgId – Name: Default Data: MDACVer.Version

Re: windows update kb927779 always reoffers to install even ahead

After checking the above, press the F3 key at the top of the keyboard.
[That's the same as clicking Edit, Find Next]

The CurVer subfolder of the MDACVer.Version folder should now be open.
In the right frame, for Name it should show Default, for Data it should show MDACVer.Version.2.81

Now click the CLSID subfolder right *above* the CurVer subfolder
The right frame should show:
Name – Default Data – {54AF9350–1923–11D3–9CA4–00C04F72C514}

Click the PLUS sign next to the folder right *under* MDACVer.Version,
MDACVer.Version.2.81

Then click on the CLSID subfolder
It should show Name – Default and Data – {54AF9350–1923–11D3–9CA4–00C04F72C514}

Close the Registry editor.
Please post back with your findings, solution.

I have download the Component Checker and run it:
I choose the 1st option—automatically detect the released version—it prompt " Unknown"
Then, I choose the 2nd option— and select " MDAC 2.8 SP1 On windows XP SP2"
I found that— at COM details, all the " HKEY_CLASSES_ROOT\clsid" were mismatch"

Then I run System File Checker tool on a Windows XP SP2–based computer by Insert the
CD XP SP2.

Restart and run Component Checker again,still same, " HKEY_CLASSES_ROOT\clsid" were
mismatch"

And try to install the KB927779,still prompt success but it still show need to update?

Pls kindly advise.

Re: windows update kb927779 always reoffers to install even ahead

Re: windows update kb927779 always reoffers to install even ahead

Please see this: Component Checker: Diagnose problems and reconfigure MDAC installations

<http://support.microsoft.com/kb/307255>

IF MDAC has an 'issue' and 2.8 SP1 came with the OS, then to repair it you would need to run sfc /scannow

Description of Windows XP and Windows Server 2003 System File Checker (Sfc.exe)

<http://support.microsoft.com/kb/310747>

You are prompted to insert a Windows XP SP2 CD when you try to run the System File Checker tool on a Windows XP SP2-based computer

<http://support.microsoft.com/kb/900910>

That will work if you have an XP CD that also includes SP2.

OR, if SP2 was not on the original XP CD and was installed afterwards, then instead of the inserting a CD when prompted to, Browse to SP2's location
WINDOWS\ServicePackFiles\i386

I have uninst KB927779 [make sure the 'Show updates' box is checked].

But I cant find MDAC 2.8 SP1 from Add/Remove Programs in the Control Panel.

My OS is XP SP2,the MDAC come with it.

how I remove MDAC 2.8 SP1 from Add/Remove Programs?

thanks

Re: windows update kb927779 always reoffers to install even ahead

Check to see if KB927779 is listed under
Windows XP – Software updates
If it is, uninstall it [make sure the 'Show
updates' box is checked]

Uninstall MDAC 2.8 SP1 from Add/Remove
Programs in the Control Panel
Restart the system even if not prompted to

Download and SAVE:
MDAC 2.8 SP1

<http://www.microsoft.com/downloads/details.aspx?FamilyID=78cac895-efc2-4f8e-a>

KB927779

<http://www.microsoft.com/downloads/details.aspx?FamilyId=6B0CDB65-AEF4-489>

Install MDAC 2.8 SP1 first, restart if
prompted to, then install KB927779

***STRONGLY SUGGEST** completely
disabling the installed antivirus* from
monitoring the system while installing both
MDAC 2.8 SP1 and KB927779.

OS pc is winxp sp2. Installs
windows update kb927779
manually or via
windowsupdate website
,prompt success. check the
update history, this item is
installed successfully.

But check the
windowsupdate website,will
show kb927779 still need to
installed,even the wsus
server also shown the
kb927779 needed(client

Re: windows update kb927779 always reoffers to install even ahead

report to wsus every hour)

even restart also same..

reinstall MDAC 2.8 SP1 (by
c:\windows\inf ---mdac
install) and restart and
install kb927779 again same

I have try the below also
fail:

```
run from cmd prompt
net.exe stop wuauserv
regsvr32 wuapi.dll
regsvr32 wuaueng.dll
regsvr32 wuaueng1.dll
regsvr32 wucltui.dll
regsvr32 wups.dll
regsvr32 wups2.dll
regsvr32 wuweb.dll
net.exe start wuserv
```

restart pc,reinstall kb927779
,same problem....not work
