Ouch. I doubt whether SubInACL works in Vista.

Could you please post a section of the WindowsUpdate.log by going to Start > Run > type in

%windir%\windowsupdate.log

Click OK

If possible, locate a section of the log from around 3/20/07.

If not, start at the bottom and work your way up to a section that shows an ERROR, WARNING, or FATAL. Then copy&paste that along with 30 or so *preceding* lines into your reply, please.

After reading this conversation and the attempted fixes, I am having similar difficulty getting Windows Updates on Vista except I am getting error code 80070490. When trying the fixes, I am also running into the same error messages. Here's a few more details that will hopefully help resolve this problem for myself and others (hopefully without having to reinstall)...

1. Only running AVG Anti-Virus
2. The Subinacl tool errors on HKLM\Software\Microsoft\WindowsNT\CurrentVersion\Permissions or a subkey of that (the DOS window is not wide enough to see the full key)
3. Windows Update history shows that all Microsoft Updates (Office, Windows Defender, and Malicious Software Removal Tool) ARE being downloaded and installed automatically.
4. Last Recommended Update was on 3/20/07 - KB932246 "Failed"
5. The last successful update was on 2/27/07 - KB929685 "Successful"
6. Control Panel > Programs and Features > Installed Updates shows "No updates are installed on this computer"

Hopefully this helps get this problem resolved.

the commands you gave me to put into cmd all worked fine
apart from one:

regsvr32 wudriver.dll

to this i have a regsvr32 window pop up saying >>

The module "wudriver.dll" was loaded but the entry-point
DllRegisterServer was not found.

Make sure that "wudriver.dll" is a valid DLL or OCX file
and then try
again.

<<

wuwebv.dll is version 7.0.600.374

thanks for all your help. i've now got hold of a microsoft
support team

guy who is trying to help me too, by email. will post any
results here,

but i fear it could take some time!

a

You're mowst welcome. Let's see if MS support is able to get wuwebv.dll up
to the latest Version, 7.0.600.381.

'Us' MVPs have been letting MS know through our 'channels' that they really
need to provide some place where someone in your situation can
download the latest WUA in order to install it manually.

In fact, I've pointed them to this thread as an example of why they
really **need** to do just that.

Keep us posted and hang in there ! Do NOT let them tell you that the only
resolution is to reformat/reinstall Vista to resolve this issue.

If they do, contact me, please. Same Username but at
gmail.dot.com
