Thank you , thank you!! My hard drive crashed last week and I had to replace it. After loading XP SP2, I couldn't figure out why it wouldn't update—I was also getting the exact same message. I was about ready to throw the laptop against a wall when I read this article. I registered the DLLs as described, and FINALLY the updates are installing. THANK YOU SO MUCH.

Thank you very very much for this great post!! I have been pulling out what little remaining hair I have trying to figure out why updates were not being loded after I did a repair of XP SP2 from the original installation disk two days ago. My problem EXACTLY matches that described in your link. Until I saw it, I was wondering what the heck did I do wrong -- I guess that unfortunate timing in deciding to repair my installation of Windows XP along with Microsoft's faux pas was the entire reason for something that I was blaming myself.

The fix is here, and it seems Microsoft Screwed us again.

From the Langa website "However, after using the repair option from an XP CD-ROM, Windows Update now downloads and installs the new 7.0.600.381

executable files. Some WU executables aren't registered with the operating system, preventing Windows Update from working as intended. This, in turn, prevents Microsoft's 80 latest patches from installing even if the patches successfully downloaded to the PC."
