Did you manage in the end? Or still having this problem? I do, and I don't know what else I should do. Tried everything I think. Still get 8007000B. If you can help I'd be grateful. Thanks.

Hi,

I'm running Windows Vista Home Premium on my computer and I keep getting an error message every time I try to update. The update is always the same: KB930857, and the error code is also the same: 8007007B. Since this started happening, I can't download any other update(s).

Can anyone help me, please?? I tried everything in this post, but nothing worked.

Hi,

We are sorry for issues in installing the updates.

Can you please follow the instructions below and let me know if it resolves the updates failing with 8007000b issue.

1. Open an Administrator command prompt by right clicking on Start -> All Programs -> Accessories -> Command Prompt and selecting "Run as Administrator" and clicking "Allow" for the elevation prompt
2. In the command prompt, type the command below
fsutil resource setautoreset C:
(This assumes that C: is the drive in which Vista is installed. If it is installed on another drive like D:, please change the drive letter appropriately)

Re: Error code 8007000B when trying to install updates

3. Reboot the machine

After reboot, please try to install the updates again and let me know if that resolves the issue.

What filter were you using? E.g. perhaps try filtering on the program name which is doing the write to WindowsUpdate.log?

I suspect you are probably chopping off useful context here.
E.g. what was happening just before this?

The line before was simply the download process reporting that it had the file OK, followed by a rather long gap in time (about 0.5 seconds) where the process monitor shows a few thousand entries.

Similarly if you find the write for this record in your ProcMon trace what was happening before that regarding *other* file accesses by the same program? Etc.

Re: Error code 8007000B when trying to install updates

Yeah, the problem is that I can't see anything particularly obviously wrong, and there are so many entries, I'm not really sure where to begin looking anyway.

The rest of this will only be useful to someone who has access to internal documentation. E.g. that would be where things like CBS and 106 would be defined and described, as well as the overall program flow.

I did look in the CBS log for the same time, and found a code (possibly error code) which appeared in process monitor for some entries too:
0xc0190005
That mean anything to anyone?
