Is there a fix yet for the IE6 crash issue caused by KB924615? It appears that the patch is automatically included in the SP3 RC, and cannot be removed. Any idea whether a fix for the KB924615 URLMON.dll issue will be published by the time SP3 is final-released, or will we have to forego installation of the service pack? Upgrading to IE7 is currently not an option.

Alternatively, is there a workaround for the patch that actually works, other than uninstalling it? We need something that could be quickly implemented, and distributed centrally to hundreds of machines.

I've seen this patch pop up on numerous other forums, so much so that it made the tech headlines on Google news and PC World, so I know we're not the only ones who have seen the issue...

Thank you!

1. XP sp3 is a beta.
 2. XP sp3 should be putting you back on the GDR bits and thus should not cause this crash
 3. Yes there is a fix out now and it's on Microsoft update.
