Yes, the disk has been changed out and restored from a backup. I expect to require a disk swap again, and assume this is the resolve for those actions.

I had tried installing these manually (Custom install) a few times, but failed at all attempts.

Thanks

Different hoops –

Error 0x8020000E is: BG_E_VOLUME_CHANGED

"The destination volume has changed. If the disk is removable, it might have been replaced with a different disk. Reinsert the original disk and resume the job."

Try renaming/deleting the SoftwareDistribution folder you but you will lose your WU History listing (not important). If everything is working okay again you can delete the renamed SoftwareDistribution folder.

Renaming the SoftwareDistribution folder

Click Start, Choose Run.
In the Run box, type services.msc.
Click OK.
Right-click the Automatic Updates service.
Click Stop.
Stopping the service will take a moment.

Rename the "SoftwareDistribution" folder: a. Click Start, click Run, type %systemroot%, and then click OK.
b. Right-click the SoftwareDistribution folder, and then click Rename.
c. Type SoftwareDistribution.old, and then press ENTER to rename this folder.

Re: update installation failure of the .net 2.0 update

Click Start. Choose Run.
In the Run box, type services.msc.
Click OK.
Right-click the Automatic Updates service.
Click Start.
Starting the service will take a moment.

Or try manually installing the updates.

IBM T30 system, XP SP2, fails the .net 2 and .net 3 updates with Error Code:
0x8020000E

Is this the same resolve or am I misplaced (shall I jump the hoops same as directed here)?

"MowGreen [MVP]" wrote:

IF this is Windows XP, then download the automated
removal tool:
http://astebner.sts.winisp.net/Tools/dotnetfx_cleanup_tool.zip

Now read this:
<http://blogs.msdn.com/astebner/archive/2006/05/30/611355.aspx>

Run the Removal tool and have it remove .NET Framework
2.0 ONLY.

If you get an error message that it could not be removed,
leave the tool
open and restart the system.

Download and save .NET Framework 2.0:
<http://www.microsoft.com/downloads/details.aspx?FamilyID=0856eacb-4362-4b0d-8edd-a7>

Same for .NET Framework 2.0 SP1
<http://www.microsoft.com/downloads/details.aspx?FamilyID=79bc3b77-e02c-4ad3-aacf-a7>

When the downloads are complete close the browsers and
any other open
programs.

*** IF the ATI Catalyst Control Center is installed, close it.

Right click the icon and choose Exit or Close.
You will also need to disable it from running when the
system is
restarted. Don't recall if it runs a Service, but you can check
in the
Services console to see if it does –

Re: update installation failure of the .net 2.0 update

Start > Run > type in

service.msc

Click OK or press Enter

Look for anything ATI in the right frame. IF it exists there, and I mean

the *ATI Catalyst Control Center ONLY*, double click it and set it to

Disabled next to Startup type. Click Apply, OK. Close the Services console.

Back to Start > Run > type in

msconfig

Click OK or press Enter

Click the Startup tab

Look for the ATI Catalyst Control Center under Startup Item.

If there, UNcheck the box next to it.

Click Apply, Close.

Click NO the prompt to restart now.

Create a folder on the root drive [the drive where WINDOWS is installed

to], usually, the C:\ drive. Name it DotNet.

Move both downloaded files to that folder.

Now install .NET Framework 2.0 [dotnetfx.exe]

Restart if prompted to.

Now install .NET Framework 2.1 [NetFx20SP1_x86.exe]

Restart if prompted to.

Visit Windows Update via the Start Menu link or open IE and click Tools,

Windows Update. When the initial scan is complete click the Custom scan

button.

IF any updates are offered for .NET Framework 2.0, write them down in

the order they are listed.

Then head over to the MS Download Center once more and download and save

them.

Move them to the DotNet folder and install them from there

*in the order

they were listed*, restarting the system when prompted to.

Did that get it/them installed ?

NOTE: Remember to reenable the ATI Catalyst Control Center afterwards,

if you so desire. If you don't, suggest you uninstall this

Re: update installation failure of the .net 2.0 update

'feature'.

ALSO, if any Intuit product is installed [Quicken, Quickbooks, etc] you

may received an error message after the removal of .NET 2 and subsequent reboot.

That's because the software can not run without it being installed.

Just close the error window and get .NET 2 installed to eliminate this error.

I recieved a 1603 error code , as listed in computer managment event viewer .

I also went to add and remove programs, and tried both a repair install and a uninstall. Neither worked. I recieved a pop up window, that said the patch package could not be opened.

For now, I'll try some of the links you listed in your reply.
