I have been trying to get the new Service Pack 3 to install on my computer for days.

I have even tried to download the update more than once thinking I downloaded a corrupt file. It will run through the installation of the files then it tells me it's not allowed. It then tells me that there was a service pack 3 setup error, and that the install did not complete. After I click 'ok' windows runs the removal wizard and uninstalls everything that it already completed. This has happened several times already. Has anybody encountered this already. If so how do I fix it. The computer is running fine but I've had to shut off the automatic updates until this get fixed...
