Thanks Paul, but i have already some problem.

I wil try to explain situation better:

i use a CEPC with 2 serial port (3F8/IRQ4 and 2F8/IRQ3).

If i connect the com1 with hiperterminal during boot of image i can see debug message. When image is loaded i put the cable on the other serial port (com1 for the image but com2 of the pc), create a new connection onto cepec for com1, start repllog and i can see in hyperterminal the string CONNECT. Finally i stop Hyperterminal and try to connect with activesync. On my pc after a while i have the green icon and sayd CONNECTED (guest). At this point no synchronize windows appears (but with emulator it appears). The two pc seems connected but i try to explore files, only an empty folder appears. I have tried to use some remote tool on PB 5, but the test for the default connection for some combination of Transport and Service always failed.

You said: " I just get the feeling that you haven't followed the required steps. I've covered setting this up for serial connection before. "

I searched where you told me, and i find o lot of thing, but i'm not sure what are the required step to take. Can You help me a little?

Thanks again.
