Hi, this is my first development project for mobile devices. I hope someone can point me in the right direction and tell me software and tools i would need to achieve the following.

1. A PocketPC 2002 would be connected to the local network using a Wifi connection.
2. The PDA would have to view and update some data on either a SQL server or in an Access MDB file in real time.

It's a very simple task but with so much tools and so much stuff out there i just wanted to get some opinions of what's the easiest way to go.

Thanks alot for any help i can get.
