Hope someone can help.

I have eVC++3 installed and working ... almost.
I can compile and the programs run on my iPAQ.

The trouble is i can't debug as the compiler doesn't find my device ... this is irritating, as i had it working with eVC++3 and the SDK previous to PPC2002 (the device has been upgraded to PPC2002).

Whenever i need eVC++ to connect to the device i get the Error message :
'There is no device installed. Please go to Configure Platform Manager to add a device.'

When i go to Tools – Configure Platform Manager ... select MyiPAQ from the devices and set it up for :
Transport : TCP/IP, Startup Server : ActiveSync
and then test, the test works fine.

ActiveSync is connecting through a wireless TCP/IP connection and works fine.

I have also tried disabling the network and connecting via USB using PPP for the Transport – this also _tests_ fine but isn't found by eVC++ to debug or transfer files.

I have no other troubles with any other apps finding or interacting with the device.

Desktop :

ActiveSync 3.7.1.3244

eVC++ 3.00.0099.0

Pocket PC 2002 platform

MyiPAQ

Pocket PC 2002 Emulation
