I have been struggling with this problem for several weeks now and could really use some guidance. I am trying to create an ActiveX component and load that component into an application using PB 4.2 and eVC 4.0. I build the OCX with both eVC and VC6 (to get the design version) without any problems. The design OCX loads into my eVC program and displays properly. Everything seems to work from the build/download/run until I try to load the dialog box that contains the OCX. I keep getting the error 1407. I have tried to debug the problem but can't get to my OCX code. If I put a breakpoint in the dialog handling routine of the app, it gets there once with a window message value of 71. From there the program is hosed. I tried to put a breakpoint in the OCX constructor but it never gets there. Any advice would be greatly appreciated and could very well save what little remaining sanity I have.
