First of all, make sure the versions of CMAccept.exe and ConmanClient2.exe you have in your shared directory actually match your processor architecture (x86?). Also, make sure your image include all OS dependencies for .net cf 2, and finally, conmanclient2 should be up and running before you launch cmaccept.

Hi Chris,

Basically I just click on those exes that I have in my shared directory using Windows Explorer on my Window CE 5.0 device. Or I type the name or the executable at the command prompt. I use Platform Builders Remote process viewer and the exes are not showing up as processes.

Hi

I have a Mini ITX mother board that I am using to boot Windows CE 5.0 from a compact flash. I would like to use Visual Studio 2005 debugger. When I try and run CMAccept.exe and ConmanClient2.exe they won't run. Is there a reason for this or another way without having to use Platform Builder to load the operating system? Anyones help here would be greatly appreciated.
