I want to have 24-bpp (RGB888) unpacked format , display driver for our device. Currently WinCE provides only GPE emulated routines for 16bpp display format. For 24 bpp, only generalized routine is there and i fear using this will cause lot of performance issues . So, is there any open source 24-bit routines(line drawing, BitBLT) for GPE based display driver.

Thanks in advance.
