What multicast group have you joined? There have been problems in the past with groups of certain formats (which you can find by searching the archives of microsoft.public.windowsce.* via GoogleGroups advanced search). Maybe those haven't been fixed...

Hi,

I have an application that uses multicast when i run the code, multicast frames are transmitted and the code receives the multicast frames it transmitted but does not receive multicast frames from the network. I dropped

a CE6 multicast receiving example into the code from Microsoft and that also

does not receive multicast frames. I have tried the code in both the device

emulator and the target board with the same results. can anyone point me in

the right direction to resolve this issue.

TIA

Richard
