hi shankar,

provision the application. The only thing I was not able to follow was how the BOOTSTRAP\_GET\_FROM\_DHCP and ServerInfoLocation works and why it did not work for you.

didnt work for me because my DHCP is WiFi router which dont run FTP :)

provision (instead of FTP) by placing the xml file in a particular location in the device and reboot, so that it picks up the new settings. If there is anyway to do that, it would be helpful.

i agree; no normal voip users(except enterprise deployments) will use networked based provisioning. Just dig into the save tasks part of <http://msdn2.microsoft.com/en-us/library/bb667108.aspx>. It will be simple; as for now i am head down on other project. If i find sometime and get info on this i will post here. If u find it let me know!
