Hi All

We are trying to logon to W2K3 server from X86 based CE 5.0 thin client using smartcard. We get PIN dialog but can not logon. It seems W2K3 can not retrieve the certificate from the card. However, after manual logon we can access the card and perform some operations (not related to digital certificates). We are able to logon to same server using same smartcard and same client hardware running Windows XP. I wonder if I need to include any additional Windows CE components to perform smartcard logon. Are there special functions for storing/retrieving certificates on smartcards which may be missing in the driver we use (its a thirparty driver w/o source code)

Any clue higly appreciated.
