Have you added "Agfa AC3 Font Compression" support for your image?

Hi Henry,

I made a clean build now.but still the korean fonts are not getting displayed properly.I referred the following link for the registry settings(<ms-help://MS.WindowsCE.500/wcefonds5/html/wce50conFontRegistrySettingsforKorea.htm>) and my platform has the same registry settings as given here.

So i dont know where is the problem.I still get a sequence of squares.Im able to see the Gulim.ac3 file in my device.Previously i generated a build with Japanese locale and it is working fine for me.I have built a sample MFC application in Visual Studio 2005 with korean resource file and ported the same to my device.But im not able to get the korean font.

Can you help me in this regard?

Have you checked the "localize the build" option in project settings?
What default language do you use? Have you done a "sysgen" with "clean before building" option checked?

Re: Unable to display korean fonts

Hi All,

I have built my platform and i have selected the Korean option in the locales list in PB and have selected the codepages 949 and 1361. But when i run my application in the device im unable to see the korean fonts.

It is shown as a sequence of squares. Im also able to see the gl_ce.ttc file in my device. Can anyone help me in this regard?

Thanks & Regards,
Ravi
