Uh, that would be because there isn't any good documentation on polling. Polling is just checking something periodically. It would be different based on requirements.

Hello,
Could someone point me to a device driver in winCE 5 that does polling to access data from a device. I need to develop a i2c driver for a device that does not have interrupts. So I need to use polling mechanism in driver to implement a driver for the device. I could not find any good document on polling mode for device driver in PB document.
Thanks for your help.

THanks,
Shiju
