Thanks All

This has now been resolved after my latest Clean Sysgen. My DLL is now in my image and the registry on the target shows the correct entries. However, I expected to see some debug messages from the driver on the debug output serial port, but so far, nothing. Any ideas please?

Best Regards

That is fine, just wanted to make sure that was what you were talking about and not that you were referring to something else.

That should work, so now the question is why not.

A subproject as shown in the Visual Studio 2005/Platform Builder 6.0
Solution
Explorer:-) What is a userproject? a term from an earlier version of CE

Re: Stream Device Driver How-to

perhaps?

Phil

Remove the nospam section from my e-mail address.

Phil:

What do you mean by subproject? During makeimg,
public\common\oak\misc\premakeimg.bat runs and creates
PBUserProjects.bib
which should include the bib files from the user projects.

I suspect that you either don't mean the same thing by
subprojects as PB
does, or your subproject isn't setup correctly for bib files, like
it is
for
reg files.
