You don't have to change you h/w design. Just play with "Folder" parameter under storage manager profile key:

```
HKLM\System\StorageManager\Profiles\HDProfile  
"Folder"="My_HDD_Folder_Name"
```

```
HKLM\System\StorageManager\Profiles\PCMCIA  
"Folder"="My_CF_Card_Folder_Name"
```

x86 Device with IDE CF card on Secondary Master, harddrive on Primary Master. ATAPI driver enumerates the devices as harddrive = "Hard Disk" and CF card = "Hard Disk2". Due to hardware design I cannot switch the connections but need to have the reverse naming, i.e. CF card = "Hard Disk" and harddrive = "Hard Disk2". I thought this could be done in the registry. I tried swapping "DeviceId" settings between "...PDC2026\Device1" and "...PDC2026\Device0" registry keys and that did not work. I tried introducing "InstanceIndex" keys and that did not work.

Does anyone know how to coerce the IDE device enumeration to get the naming I desire?
