Sounds like you may have found a bug with legacy compatibility when working from Word 2007. Perhaps Servicepack 1 has resolved the issue.

Yes, it still behaves badly when Track Changes are off. But your response did force me to look at other issues. Originally I created the document in native (.docx) 2007 format. After I completed the document I had to distribute it to other reviewers who had to see it in 2003 (.doc) format. Since then I have been editing the 2003 (.doc) version. I just found if I resave the .doc back as .docx then I can edit the headers/footers without the CPU spike so I have a work around.

I hope this serves as a warning (or reminder) that if you save to the older version for review by others that you revert back to 2007 format to continue editing.

Does this happen when Track Changes are OFF?
