The only addins which i have installed are the following

Active Applications

pdf995.dot (has been installed for more than 8months)

Person Name (outlook e-mail recipients)

Send to Bluetooth (only one that shows up when clicking manage COM add-ins.

Cannot be removed- message "The connected state of Office Add-ins registered in HKEY_LOCAL_MACHINE cannot be changed

Inactive Applications

Custom XML date

Financial Symbol

Date

Headers Footers and Watermarks

Hidden Text

Measurement Convertor

Telephone Number

Time

Document Related Add-ins

None

Disable Application Add-ins

None

Further info on printing problems

When i click File Print I am returned to the document with no response printer wise

When i click the Quick Print button i receive following error

Windows cannot print due to a problem with the current printer setup

Show Help>

This error can appear if a default printer has not been designated or if the application is unable to locate an existing default printer. To correct this problem, try one of the following in Microsoft Windows:

If a printer is not available in the Print dialog box, add a printer.

If the application cannot find an existing printer that is already installed, set the printer as the default printer.

If a default printer is installed but the application is unable to use it,

Re: Windows cannot find C:\ (doc) Make sure you typed the name cor

uninstall the printer driver, and then install the latest version of the printer driver.

If the printer is on a print server, make sure the printer is available, the network is functioning, the server is not stalled, the printer is not out of paper, or the printer is not suspended by the administrator. Printing issues associated with a network printer are best handled by your local network administrator.

For more information about setting up and troubleshooting printer connections, see Windows Help and Support. (Click the Start button, and then click Help and Support.)

The printer i am trying to print to is a network printer. I have tried removing it and readding it. It is in my printer control panel, shows as default, and can be printed to from other applications

Outlook 2007 no longer uses Word as its email editor, so double-clicking an attachment in Outlook is just a red herring as it doesn't open Word.

This sounds more like an arrant add-in is at work. I suggest removing all add-ins and testing to see if that removes the problem. See how to find add-ins

Ive just started having this problem myself

So far i can confirm its not antivirus, firewall, BCM or firefox which is causing the issue

Its possible it has something to do with printer drivers as i can no longer print from word.

However as background i have had Vista ultimate and office basic loaded on this pc with the same printer for the last 12 months without issue

The problem for me started with double clicking an outlook attachment.

Re: Windows cannot find C:\ (doc) Make sure you typed the name cor

Re: Windows cannot find C:\ (doc) Make sure you typed the name cor

Since

then i have no longer been able to double click a word file from anywhere in

windows explorer or outlook without getting the error message. Right click and open with word gives me no error message but word opens without the file

opening and then freezes

The only way i can access a file is to open word. then use the File>open dialog

I have tried the following steps so far

I have removed the network printer from my pc

Have 'repaired' the word installation

Have removed and reinstalled word

Have deleted the word data registry entry

Have deleted the word addins registry entries

Have tried the winword /r fix

So far no luck. Any other suggestions from anyone lucky enough to have fixed

the problem so far

"Jim Scrivener" wrote:

This Vista & Word 2007 problem has been raised by a small number of users in different locations but there has been no satisfactory solution.

It remains unclear why only a limited number of users have it. But for those who do, it is a devastatingly annoying issue – one that renders Word 2007 almost unusable.

The problem:

When you double-click on any Word doc or docx icon – or attempt to open it from Outlook email – it opens a blank page in Word 2007 and you see the message "Windows cannot find C:\ (doc) Make sure you typed the name correctly, and then try again".

On trying a second time simply double-clicking the same icon opens the document in 90% of cases – though there is occasionally a

Re: Windows cannot find C:\ (doc) Make sure you typed the name cor

second failure
like
the first.

This problem means that every document has to be "opened"
twice – a huge
waste of time. (though opening a doc / docx from within the
Word program
works fine.)

Note: this also affects Excel 2007 – but I have used this less
so am not
so
sure if it is equally.

Before you respond with solutions – please note:
This problem is unresolved ie ...
All the supposed Firefox solutions including registry
alterations make no
difference.
Changing or uninstalling Virus programs makes no
difference.
It is not just an issue to do with .doc vs .docx
I have uninstalled & reinstalled Office. I have doubled the
PC's memory.
I
have altered every setting I can think of altering (and that is a
lot).
Nothing makes any difference.

Can anyone help or suggest anything? I strongly suspect a
program clash –
but with what?

A possibly related problem (and possible clue??):

On choosing to SAVE Word attachments rather than open
them directly from
Outlook they save as type "All files" unregistered to any
program (with
no
alternative allowed). This leads to a long-winded opening or
renaming
process
afterwards.

Any help ... please?
