No point having passwords if you are going to write them down where all can see. However to overcome your immediate problem, set the screensaver to show the welcome screen on resume and add a shortcut to the desktop to activate it when you leave your PC unattended. To ensure the password activates, you will need a little utility −eg http://www.jsifaq.com/SF/Tips/Tip.aspx?id=0302. Note that the password only activates after the number of seconds you set so if the screensaver activates through inactivity or you click the button by accident, you will not have to log−in to Windows again to restore the screen.
Alternatively switch your PC to standby when you leave it.

> lI have a password protected document with all my user names and passwords. I would like to know if there is a way to hide the open window so that it will only show on the screen when I hit a pre−assigned hot key combination. Just leaving it on the task bar is iinviting curious eyes to copy the info when I am away from my desk for a few minutes. I use this list all the time so I don't want to constantly open and close the document.
