Thanks for the solution – it works great!

Close all open applications, run regedit, rename the Windows registry key
HKEY_CURRENT_USER\Software\Microsoft\Office\11.0\Common\LanguageResources,
exit regedit, restart Windows, and restart Word (Word should automatically rebuild the key you just renamed with the factory default settings).

I trashed all but English, then restarted...no change.

What it's doing is complicating some standard style presets we use in certain document templates...making a minor tweak to a standard custom style from a clean template results in the stylename modifying itself on the Style menu with the notation "(complex)", which simply confuses everyone. We typically reuse (with some custom tuning) the same basic templates from project to project. With a project having anywhere from a few to 50+ contributors, the potential for confusion (and style conflicts when documents are merged) is really aggravating.

The fact that the behavior then migrates virus-like to the PC of every user who uses the file is really ticking us off. The simple Font dialog box (CTRL-D) gets additional panels added that show Arabic script, among other things.

Spur any insights?

Re: Enabled languages

I know nothing of Mohawk – might its script be considered complex by Word?

I'm just looking for explanations – none of it should really matter. I agree

it does sometimes appear infectious (and is carried in documents) but all

Word is showing you is attributes it will use for complex fonts – if you use

them. If you don't use them, none of the settings should affect anything

else. You say it is wreaking havoc – what exactly is it doing?

English, French, Polish, and Mohawk.

If anyone
has a
solution, I'd
like to hear
it as well.

Re: Enabled languages

I've tried
checking all
of my
language
settings
(everything
is English
US)
in both the
OS and
Office
2003.
Trashing
Normal.dot
didn't help
either.

I turned on
the
formatting
in the
Normal
style and it
indicates
the
Language
settings:

Language:
(Complex)
Arabic
Saudi
Arabia
English US

Nowhere do
I have
Arabic
Saudia
Arabia
selected in
any
language
settings...

Re: Enabled languages

Word
2003
is
inexplicably
assigning
"complex
script"
attributes
to
styles
in
our
documents,
wreaking
havoc
with
predefined
styles
we
use
in
some
of
our
standard
document
templates.
The
behavior
is
infectious
–
if
a
computer
on
which
Word
is
behaving
fine
opens
one
of
those
templates,
the
complex
script
behavior
attaches

Re: Enabled languages

itself
to
that
machine.

If
we
have
a
defined
Style
that
is
OK,
any
change
(like,
making
it
bold)
turns
it
"complex"

Anyone
know
how
to
make
that
go
away?
Have
tried
trashing
the
Normal
template
–
that
doesn't
work
