Thanks for your respons and i got the same messages from someone else. I understand what the "correct use" is and worked in situations where personal normal.dot files where used (and needed).

But in this situation we work terminal server with 10 users who all do the same work en we want to all use the same (optimized) standard procedures. The problem is that when we dissided it's better to use a new style, or something like that i have to open a session for every user to change the settings. i can give everyone a new copy of normal.dotm (thats no problem in our situation), but when you let people also make there own changes in Normal.dotm, then they wil not like the last option verry much.

My experience is that different normal.dotm files gives manny questions why computers don't behave the same.

I also thouht of using global add-ins for macro's but is this also posible for styles etc. It makes the whole situation more complex (more files and different settings for users) wich makes my work "more interesting".

I just discused it here and we think we will work with global templates, but also change the loginscript, so everyone gets the standard normal.dotm when he logs in.

I also take this change to ask you for some more information. Is there a list of things that are set in normal.dotm (and also in normalemail.dotm) and wich are set in the registry. In the last years some are clear for me, but lot off them aren't (by example themes in word and outlook2007). I found where they are stored, but where is stored wich is standard (registry or normal(email).dotm).

And to make it more complex whats in normalemail.dotm and what is in mail.oft.

I know that this is not realy the right topic, but i hope you know the answer's. (one fool can ask more then 10 wise people).
