

Re: serial numbering

Graham Mayor wrote:

OK, a variation on the code on the first link will do that. Put a bookmark at the place in your document where you want the invoice number to be printed and run the following macro:

```
Sub AddNoFromINIFileToBookmark()  
Dim SettingsFile As String  
Dim Order As String  
Dim iCount As String  
Dim rInvNo As Range  
Dim i As Long  
  
iCount = InputBox("Print how many copies?", _  
"Print Copies", 3)  
If iCount = "" Then Exit Sub  
  
SettingsFile = Options.DefaultFilePath(wdStartupPath) _  
& "\Settings.ini"  
Order = System.PrivateProfileString(SettingsFile, _  
"InvoiceNumber", "Order")  
If Order = "" Then  
Order = 1  
End If  
For i = 1 To iCount  
Set rInvNo = ActiveDocument.Bookmarks("InvNo").Range  
rInvNo.Text = Format(Order, "00000")  
With ActiveDocument  
.Bookmarks.Add "InvNo", rInvNo  
.Fields.Update  
.ActiveWindow.View.ShowFieldCodes = False  
.PrintOut  
End With  
Next  
Order = Order + 1  
System.PrivateProfileString(SettingsFile, "InvoiceNumber",  
_  
"Order") = Order  
End Sub
```

If you don't want the macro to prompt for the number of copies then replace
iCount = InputBox("Print how many copies?", _
"Print Copies", 3)
If iCount = "" Then Exit Sub

Re: serial numbering

with

iCount = 3

The next macro will allow you to reset the invoice number to the next number of choice.

```
Sub ResetInvoiceNo()  
Dim SettingsFile As String  
Dim Order As String  
Dim sQuery As String  
SettingsFile = Options.DefaultFilePath(wdStartupPath) &  
"\Settings.ini"  
Order = System.PrivateProfileString(SettingsFile, _  
"InvoiceNumber", "Order")  
sQuery = InputBox("Reset invoice start number?", "Reset",  
Order)  
If sQuery = "" Then Exit Sub  
Order = sQuery  
System.PrivateProfileString(SettingsFile, "InvoiceNumber",  
_  
"Order") = Order  
End Sub
```
