Look at the end of my last post. That is the standard way.

Here is a post from a couple of days ago on the same subject.

Mark the numpages field in doc1 with a bookmark "TotPages"

Instead of a NumPages field use something along the lines of:

```
{ = { NumPages } + { INCLUDETEXT "doc1.doc" TotPages } }
```

You could do something similar with the X part as well so that you do not

have to manually adjust the start of page numbering.

BTW, Word will work with quite large documents. I have one with more than 5000 pages including a Table of Contents that references every page at least once.
