Right. OK, I just tried a quick test on my installation (Word 2003) and I'm not seeing the problem. So I'm guessing this may be an issue in this set of documents.

If you:

create a new document with a few pages (type this then, press Enter:
rand(30,6)

Then insert a heading at the top, and a cross-reference to that heading with the page number at the bottom. Now save and close.

Now create another multi-page document and insert/file with link for the first file you created...

...does the field behave correctly?

If it does, then we can be reasonably sure we're dealing with some kind of structural damage in one or the other document.

In this case, first try inserting a link to a "chapter" document into the second test document. Does it behave correctly in this document?
