Hi,

I have an Access Database that I want to export about information from four fields on the current record to a word document. The document is a two page legal size doc but I only want the first four fields on top to load from Access. I would for the user to click on a button from the form in access that will populate these fields and then automatically print the document when finished. Is this possible? If so, how involved is it as I have never tackled anything like this before.

Thanks to all who reply!!

.
