Hi Magdalena

When you use the template, do you always create a new document from it? Or do you re-use the same file?

Does the previous Excel file still work correctly?

Generally, when one sees this problem between Word and Excel, it's usually caused by damaged file structures in either the Word document or the Excel workbook. The problem is determining which is the cause, and figuring out how to work around it with the least loss of time and data. If older combination of Word and Excel are still working, then the problem is most likely in this workbook.

At this point, I'd try exporting (save as) the Excel file as a delimited text file. Then try importing the text file into a new workbook.
