I have to disagree with you I'm afraid, re RW drives. It's truly not a good idea to open and edit a document on a CD, but not because Word trashes them. It's because of the excess time involved and the creation/deletion of temporary files, back ground saves, etc., that create very very long wait times, often fooling users in to thinking the machine has locked up, especially when the Page File maxes out.

Trashing files that way only happens with impatient people, or when a system is set up improperly. I often do it to just change a word or sentence or two, but to do any amount of work, you do indeed really need to bring it to the hard drive to work on it. However, there is no problem with using Save As to save the final document to the CD AS LONG AS you don't want to keep a local copy on the hard drive.

It is best, as mentioned, to work on the file on the hard drive, save it there, and THEN Save As or copy it to, the CDRW.

Now, since a CDR cannot support the deletion of anything on it, meaning it's write once only, it gets pretty messy and impractical to edit a file on the CD. In fact, it's impossible and Word will complain loudly, especially when the many files being created have filled the CD, the older temp files still exist, and there's no more room left because of all the multiple files already created in tryin to edit it there. You can only add to, not edit or delete anything on a non-rewritable CD.

It's always best to copy to the hard drive, edit, then copy back to CD or CDRW. The packet writing software, or lack thereof, can also create confusion, and lots of it.
