I'd been hoping that someone who actually knows or has experience in this area would answer, but apparently not...

As far as I know, this is not possible. The EXCeption file has to be where Word expects it, and this would be in the same folder as the *.lex file for older versions of Word; in the users' profile listings for newer versions.

The only possibility that occurs to me is that there might be something that could be done using a policy. However, that's where my knowledge of policies end - I know they exist :-). You'd find more information on policies in the Office Resource Kit (ORK); and people who know how to use them most likely in the word.setup.networking newsgroup.

The only other suggestion I could make would be to have a batch file copy the EXC to the correct location during log-in, so that the dictionaries are always up-to-date.
