If you have Acrobat 5 you can get around the filename prompt by using a registry setting. Although the Word PDF project is password-protected, the equivalent Excel macro is not, and the two work in the same way. Step through it and you'll see that it works in two parts: part one gets the file name and writes it to the registry; part two calls the PDF writer itself. You can write your own function in Word that puts the filename into the registry then calls the writer.
