I've been programming in Access VBA for quite a few years and am branching out to Word (smile).

I've designed a 3 page form in word (2003 SP2). I am also new to forms.

I thought it would be a good idea if I had a submit button on the bottom of the form and when pressed, save it and also send the parsed data to another directory.

I can figure out the code for the process if I can only get the button to work!!!

I have a statement on the click event like:

```
if msgbox("Are you sure you are finished?",.....) = vbok then  
do something  
endif
```

I put a break on the do something line.

When I click on the button, nothing happens. I took it out of design mode (I'm pretty sure) and even tried to protect it to only filling out the form.

I'm sure there is a very basic answer (no pun intended) here. I'm just missing it.

Thanks.
