That's not so much what I meant (sorry for the delay...been out of town). If you try some code in VBA from within whatever application and it doesn't work, how do I know what references to check to MAKE it work, since the help files never say "this functionality only works if you reference blah blah"

That is usually because the object you are using is not within the object model for that application. Its a bit hard for Microsoft to document everything that isn't there as well as everything that is!
